

* Launch Sites Locations Analysis with Folium

回个少去早前

The launch success rate may depend on many factors such as payload mass, orbit type, and so on. It may also depend on the location and proximities of a launch site, i.e., the initial position of rocket trajectories. Finding an optimal location for building a launch site certainly involves many factors and hopefully we could discover some of the factors by analyzing the existing launch site locations.

us exploratory data analysis labs, you have visualized the SpaceX launch dataset using matplotlib and seaborn and discovered some preliminary correlations between the launch site and success rates. In this lab, you will be performing more interactive visual analytics using Folium.

Objectives

This lab contains the following tasks:

- TASK 1: Mark all launch sites on a map
 TASK 2: Mark the success/failed launches for each site on the map
 TASK 3: Calculate the distances between a launch site to its proximities.

After completed the above tasks, you should be able to find some geographical patterns about launch sites

Let's first import required Python packages for this lab

```
[2]: import piplite
        await piplite.install(['folium'])
await piplite.install(['pandas'])
```

[4]: # Import folium MarkerCluster plugin from folium.plugins import MarkerCluster # Import folium MousePosition plugin from folium.plugins import MousePosition # Import folium DivIcon plugin from folium.features import DivIcon

If you need to refresh your memory about folium, you may download and refer to this previous folium lab:

Generating Maps with Python

[5]: ## Task 1: Mark all Launch sites on a map

First, let's try to add each site's location on a map using site's latitude and longitude coordinates

The following dataset with the name spacex_launch_geo.csv is an augmented dataset with latitude and longitude added for each site.

```
[6]: # DownLoad and read the `spacex_Launch_geo.csv`
from js import fetch
import io
          URL = 'https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBH-D583218N-SkillsNetwork/datasets/spacex_launch_geo.csv'
resp = await fetch(URL)
spacex_csv_file = los.pytes10((await resp. arrayBuffer()).to_py())
spacex_df-pd.read_csv(spacex_csv_file)
```

Now, you can take a look at what are the coordinates for each site.

```
[7] # select relevant sub-columns: 'Lunnch Site', 'Lun(Luttude)', 'Long(Longitude)', 'closs' spacer_df = spacer_df(['Lamont Site', 'Lat', 'Long', 'class']) |
| lamont_sites_df = spacer_df.grouply(['Lamont Site'], as_index_false).first() |
| lamont_sites_df = lamont_sites_df[['Lamont Site', 'Lat', 'Long']] |
| lamont_sites_df = lamont_sites_df[['Lamont Site', 'Lat', 'Long']]
```

```
        Launch Site
        Lat
        Long

        0
        CCAFS LC-40
        28.562302
        -80.577356
```

1 CCAFS SLC-40 28.563197 -80.576820

2 KSC LC-39A 28.573255 -80.646895

3 VAFB SLC-4E 34.632834 -120.610745

Above coordinates are just plain numbers that can not give you any intuitive insights about where are those launch sites. If you are very good at geography, you can interpret those numbers directly in your mind. If not, that's fine too. Let's visualize those locations by pinning them on a

We first need to create a folium Map object, with an initial center location to be NASA Johnson Space Center at Houston, Texas.

```
[8]: # Start Location is NASA Johnson Space Center
nasa_coordinate = [29.559684888593615, -95.0830971930759]
site_nap = folium.Map(location=nasa_coordinate, zoom_start=10)
```

We could use folium.Circle to add a highlighted circle area with a text label on a specific coordinate. For example,

```
[9]: # create a blue circle at NASA Johnson Space Center's coordinate with a pagup label showing its name circle = follum.Circle(mas.coordinate, radius=1800, color=*#835400; fill=True)=add_child(follum.Popup('NASA Johnson Space Center'))
# create a blue circle at NASA Johnson Space Center's coordinate with a con showing its name
marker = follum.map.larker(
masa_toordinate,
# Create an icon as a text Label 
icon_oviton(
icon_size=(10,20),
icon_anchor=(0,0),
    html='cdiv style="font-size: 12; color=#35400;"><a href="html://div style="font-size: 12; color=#35
```

and you should find a small yellow circle near the city of Houston and you can zoom-in to see a larger circle.

Now, let's add a circle for each launch site in data frame <code>launch_sites</code>

TODO: Create and add folium.Circle and folium.Marker for each launch site on the site map

 $folium. Circle (coordinate, \ radius=1000, \ color='\#000000', \ fill=True). add_child (folium. Popup(\dots))$

An example of folium.Marker:

 $folium.map.Marker(coordinate, icon*DivIcon(icon_size*(20,20),icon_anchor*(0,0), html*'<div \ style*"font-size: 12; color:#d35400;">
cbv%s</bv>'% 'label',))$

Initial the map
site_map = folium.Nap(location=nasa_coordinate, zoom_start=5)
For each launch site, add a Circle object based on its coordinate (lat, long) values. In addition, add Launch site name as a popup label

The generated map with marked launch sites should look similar to the following:

Now, you can explore the map by zoom-in/out the marked areas , and try to answer the following questions:

- Are all launch sites in proximity to the Equator line?
- Are all launch sites in very close proximity to the coast?

Also please try to explain your findings.

[11]: # Task 2: Mark the success/failed Launches for each site on the map

Next, let's try to enhance the map by adding the launch outcomes for each site, and see which sites have high success rates. Recall that data frame spaces, of has detailed launch records, and the class. column indicates if this launch was successful or not

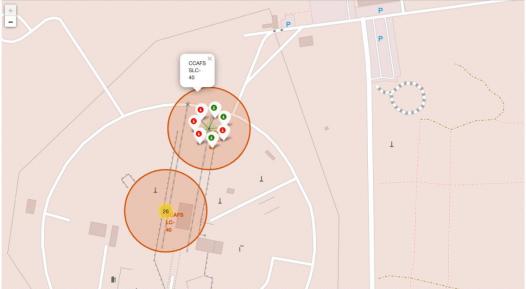

[12]: spacex_df.tail(10) [12]: Launch Site Lat Long class 46 KSC LC-39A 28.573255 -80.646895 47 KSC LC-39A 28.573255 -80.646895 1 48 KSC LC-39A 28.573255 -80.646895 49 CCAFS SLC-40 28.563197 -80.576820 1 50 CCAFS SLC-40 28.563197 -80.576820 51 CCAFS SLC-40 28.563197 -80.576820 0 52 CCAFS SLC-40 28.563197 -80.576820 0 53 CCAFS SLC-40 28.563197 -80.576820 0 54 CCAFS SLC-40 28.563197 -80.576820 55 CCAFS SLC-40 28.563197 -80.576820 0 Next, let's create markers for all launch records. If a launch was successful (class=1), then we use a green marker and if a launch was failed, we use a red marker (class=8) Note that a launch only happens in one of the four launch sites, which means many launch records will have the exact same coordinate. Marker clusters can be a good way to simplify a map containing many markers having the same coordinate. Let's first create a MarkerCluster Object [13]: marker_cluster = MarkerCluster() TODO: Create a new column in launch_sites dataframe called marker_color to store the marker colors based on the class value # Apply a function to check the value of `class` colum # If class=1, marker_color value will be green # If class=0, marker_color value will be red TODO: For each launch result in spacex df data frame, add a folium. Marker to marker cluster [13]: marker cluster = MarkerCluster() TODO: Create a new column in launch_sites dataframe called marker_color to store the marker colors based on the class value # Apply a function to check the value of `class` column # If class=1, marker_color value will be green # If class=0, marker_color value will be red TODO: For each launch result in spacex_df data frame, add a folium.Marker to marker_cluster [15]: # Add marker_cluster to current site_map site_map.add_child(marker_cluster) # for each row in spacex_df data frame # create a Marker object with its coordinate # and customize the Marker's icon property to indicate if this launch was successed or failed, # e.g., icon=folium.Icon(colon='amite', icon_colon=row('marker_colon') for index, record in spacex_df.iterrows() # T000: Create and add a Marker cluster to the site map # marker = folium.Marker(...) # marker = folium.Marker(...) marker_cluster.add_child(marker) + _

ta Habana Santa Clora Turks and Culcos Stands.

Your updated map may look like the following screenshots:

Durango México Ciudad Victo

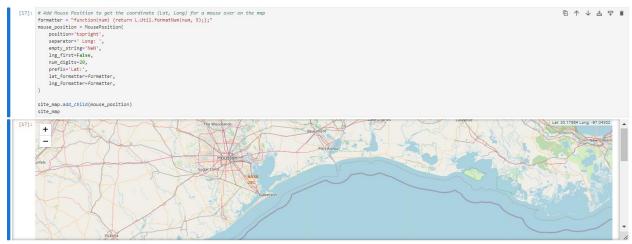

From the color-labeled markers in marker clusters, you should be able to easily identify which launch sites have relatively high success rates.

[16]: # TASK 3: Calculate the distances between a launch site to its proximities

Next, we need to explore and analyze the proximities of launch sites.

Let's first add a MousePosition on the map to get coordinate for a mouse over a point on the map. As such, while you are exploring the map, you can easily find the coordinates of any points of interests (such as railway)

Now zoom in to a launch site and explore its proximity to see if you can easily find any railway, highway, coastline, etc. Move your mouse to these points and mark down their coordinates (shown on the top-left) in order to the distance to the launch site.

Now zoom in to a launch site and explore its proximity to see if you can easily find any railway, highway, coastline, etc. Move your mouse to these points and mark down their coordinates (shown on the top-left) in order to the distance to the launch site.

```
[18]: from math import sin, cos, sqrt, atan2, radians

def calculate_distance(lati, lon1, lat2, lon2):
    # approximate radius of earth in hm
    R = 6373.0

lat1 = radians(lat1)
lon1 = radians(lat2)
lon2 = radians(lat2)
lon2 = radians(lat2)
dlon = lon2 - lon1
dlat = lat2 - lat1

a = sin(glat / 2)**2 + cos(lat1) * cos(lat2) * sin(dlon / 2)**2
    c = 2 * atan2(sqrt(a), sqrt(1 - a))

distance = R * c
    return distance
```

TODO: Mark down a point on the closest coastline using MousePosition and calculate the distance between the coastline point and the launch site

```
[19]: # find coordinate of the closet coastline
# e.g.,: Lat: 28.56367 Lan: -80.57163
# distance_coastline = calculate_distance(launch_site_lat, launch_site_lon, coastline_lat, coastline_lon)

[20]: # Create and add a folium.Marker on your selected closest coastline point on the map
# Display the distance between coastline point and launch site using the icon property
# for example
# sistance_marker = folium.Marker(
# coordinate,
icon-DivIcon(
# icon_onthor=(0,0),
# icon_anchor=(0,0),
# htms='cdv style="font-size: 12; color:#d35400;">cb>%s</b></div>' % "{:10.2f} KN".format(distance),
# )
# )
```

TODO: Draw a PolyLine between a launch site to the selected coastline point

Create a folium.PolyLine object using the coastline coordinates and launch site coordinate

lines=folium.PolyLine(locations=coordinates, weight=1)

site_map.add_child(lines)

Your updated map with distance line should look like the following screenshot:

TODO: Similarly, you can draw a line betwee a launch site to its closest city, railway, highway, etc. You need to use MousePosition to find the their coordinates on the map first

A railway map symbol may look like this:

A highway map symbol may look like this:

A city map symbol may look like this:

After you plot distance lines to the proximities, you can answer the following questions easily:

- Are launch sites in close proximity to railways?
 Are launch sites in close proximity to highways?
 Are launch sites in close proximity to coastline?
 Do launch sites keep certain distance away from cities?

Also please try to explain your findings.

Next Steps:

Now you have discovered many interesting insights related to the launch sites' location using folium, in a very interactive way. Next, you will need to build a dashboard using Ploty Dash on detailed launch records.
